

Hot nights are intensive, not on/off

June–September always had at least one night (11/11 years); July 2013 = 1, July 2022 = 25

Environmental provenance: REAL public Hong Kong Observatory Headquarters data; hot night = daily minimum temperature $\geq 28^{\circ}\text{C}$. v_{max} = 25 from this monthly file. ggplot twin of the Python Figure D SVG, sharing construction with Figure A. Identification: remaining variation after calendar-month indicators is intensity inside already-hot months. Not a health finding.
