

Residual persistence is stronger for CHD than HF

Lag-1 residual ACF: CHD 0.51 versus HF 0.15; dashed lines are $\pm 1.96/\sqrt{132}$ reference bounds

Health provenance: existing HA_APPROVED_AGGREGATE model diagnostics for the two manuscript contrasts. The stronger CHD residual persistence supports the serial-correlation-robust Newey–West uncertainty display, especially for CHD; this script fits no new model.
