

First-hospitalisation totals decline while the broad population rises

2013–2023 change: CHD -48%, HF -47%, Hong Kong population aged 35+ +17%

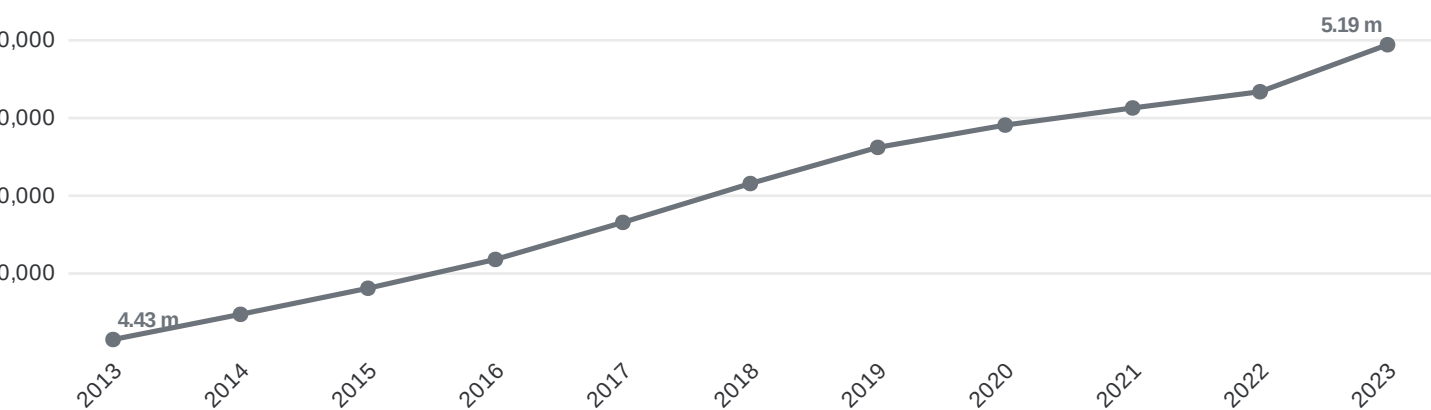

CHD first hospitalisations (annual total)

HF first hospitalisations (annual total)

Hong Kong population aged 35+ (persons; contextual only)

Health provenance: HA_APPROVED_AGGREGATE annual summaries. Demographic provenance: REAL public C&SD population aged 35+, which is not the T2D/HTN cohort risk set. First-event totals fall by about half; this is expected under a 2013–2023 diagnosis window plus pandemic care-seeking, and is not incidence without still-at-risk person-time.
