

Decisions & Data Needs — One Page

Bob Shen — Laidlaw / Bishai lab — 10 July 2026

No HA outcome results yet. HKO climate descriptives are real; population/pollution/outcomes are not.

Decisions needed

Decision	Recommended default	Confirm
Study window	Core Jan 2013–Dec 2023; 2024 optional, no delay	Bishai/Roro
Primary outcome	Emergency/unplanned inpatient, principal diagnosis	Bishai/Roro
Diagnoses	AMI; ischemic stroke; hemorrhagic stroke	Bishai/Roro
Age bands	Prefer 5-year; separate 65–69 & 70–74	Roro
ED vs inpatient	Analyze separately	Roro
Episode rule	Combine transfers; keep true readmissions	Roro
HKO exposure	Headquarters primary; multi-station sensitivity	Hogan
EPD stations	General stations primary; roadside sensitivity only	Hogan
Influenza	Sensitivity model first (not primary)	Bishai
COVID	Phases + pre-COVID + exclude 2020–2022	Bishai
District analysis	Out of scope for first paper	Bishai

Data needed

Dataset	Exact need	Status	Who
HA admissions	Monthly age×sex×dx×setting; coding; suppression flag	Blocked	Roro/HA
C&SD population	Mid-year age–sex denominators (build 65–69, 70–74)	Not yet real	Bob
EPD pollution	Monthly NO ₂ , O ₃ , PM2.5, PM10 (general stations)	Placeholder	Hogan
HKO climate	Daily→monthly extremes (already built)	Ready	Hogan review

Sharing rule

Public HKO/EPD/C&SD files, code, drafts: usually OK via institutional email. **Do not email HA extracts / unvetted secure outputs** until Roro confirms channel, vetting, and small-cell rules.

30-minute agenda

(1) Question & window (2) HA outcome definition (3) Environment/population files (4) Secure access (5) Next actions

Primary heat metric: monthly hot nights ($T_{\min} \geq 28^\circ\text{C}$). Offset: $\log(\text{population} \times \text{days})$. Effective exposure N : 132 months.
