

Locking the weather definitions with Hogan

Tuesday 28 July 2026 · 55 minutes

Purpose. Listen first, then leave with a written exposure specification agreed with Hogan before Gate 3. The graphs are exposure-only checks; there are no stroke findings or coefficients yet.

Six decisions to write down

- ☐ **Li-HW / HM23.** Season (May–Sep?); calendar-day $T_{\max}$ p90 reference and tie rule; 15-day window; ≥ 3 days; gap rule; cross-month start vs touch/burden.

- ☐ **Gate 3 pair.** Choose one hot and one cold co-primary.

- ☐ **Roro siblings.** Name HWD_Tavg, HWD_Tmax, HWD_Tmin, and HWD_Tcombined as monthly exposure siblings? Mortality RRs are not stroke coefficients.

- ☐ **Reference freeze.** 2013–2019, full 2013–2023, or a defensible pre-study/external climatology?

- ☐ **CM05.** Keep any $T_{\min} \leq 10^{\circ}\text{C}$ day as a severe-cold sensitivity, not biology.

- ☐ **Age visibility.** Show 65–69 and 70–74 if Roro’s approved aggregates and disclosure controls allow.

Starter HM / CM set

	Hot		Cold
HM23	Li-HW count p90	CM03	5 cold days
HM08	monthly mean p90	CM08	monthly mean p05
HM15	5 hot-day spell	CM15	3 cold-day spell
HM17	5 hot-night spell	CM05	any $\leq 10^{\circ}\text{C}$ day
HM19	2D3N window	CM30	cold + influenza
HM27	night heat-degree		
HM32	heat + ozone		

55-minute flow

- | | |
|--------------|--|
| 0–10 | Hogan frames the question; Bob listens. |
| 10–17 | Jasmine + Roro + monthly stroke estimands. |
| 17–32 | Lock Li-HW $\rightarrow$ HM23. |
| 32–42 | Co-primary pair + Roro siblings. |
| 42–49 | Age bands and handoffs. |
| 49–55 | Read back written decisions. |

Meeting rule

Put choices on the table; do not ask Hogan to approve a finished answer. Record his wording and circulate it to Hogan and Roro for correction.

Notes / unresolved items
