

Laidlaw Stage 3 endorsement — one page

Shen Ruililin · Professor David Bishai · 22 August 2026 · not a journal manuscript

This page is only for the HKU Laidlaw research-report form. The locked essay and poster are unchanged. Journal writing continues in Hogan's live file.

What the endorsement covers

Programme file	Research report due 31 August 2026 . Poster file due 15 September (information only; no signature now).
Ask	Satisfactory / unsatisfactory rating, comments, name, signature, date. Please by Friday 28 August , or on paper at the Thursday 27 August meeting.
Estimand	Monthly CHD and HF first hospitalisation after first diagnosis, T2D/HTN cohort, Hong Kong, 2013–2023 (132 months). Ecological count ratios, not incidence.
Not claimed	Confirmatory thermal effect; principal-diagnosis CHD/HF; AMI; stroke result; daily DLNM triggering; excess-death totals from the lab's mortality paper.

What the locked report already says

- Admission cause was not recorded. Stroke was named in the covering note and not attached.
- Twelve predeclared contrasts. After BH correction, all $q > 0.19$ (both leading estimates have $q = 0.192$).
- Exploratory CHD hot-night count ratio 1.022 (1.002–1.042) per five extra hot nights, under Newey–West lag 6; two of four uncertainty methods include 1.
- Exploratory HF cold-day count ratio 1.073 (1.006–1.144) per five extra cold days; SE-concordant, still q -unprotected.
- The conclusion ranks those two patterns as “most elevated.” That ranking is a programme-report convenience. It is not a multiplicity-protected difference between CHD and HF, and it is not a journal headline.

Ask of you

1. Complete the supervisor block on form 2a (the student fields are filled; yours are blank).
2. Confirm that these disclosure-minimised aggregate results may go to laidlaw@hku.hk after any correction you request.
3. Ignore the live manuscript and the lab heatwave-mortality paper for this signature. Those are separate files.

Optional comments paste (shorten or replace): I have examined the research report. Shen Ruililin completed a clear exploratory analysis of monthly CHD and HF first hospitalisations among people with diabetes or hypertension in Hong Kong, 2013–2023. The report does not claim a confirmatory thermal effect, notes that admission cause was not recorded and that stroke data were not delivered, and is suitable for the Laidlaw Stage 3 research-report requirement. I rate the student's performance as satisfactory.
